

Private Browsing in iOS 8

While each new version of iOS introduces plenty of new features, sometimes Apple just changes the way things are done, often without any explanation. One such example is Private Browsing. Previously, there was a Privacy button at the bottom of Safari, when viewing an index of favorites. With iOS 8, that's gone. To start Private Browsing, touch the Tabbed Browsing button in Safari. That's the two overlapping rectangles at the bottom right on the iPhone or the top right on the iPad. Then, all the open pages will be shown, along with a Private button in the bottom left. Touch that and future browsing will be done in private mode. The interface changes to a black border instead of white. Just be sure to turn Private Browsing off if you want to leverage stored passwords or history.
